Introduction

The Consumer Price Index (CPI) is an important statistical indicator for the purposes of planning and research in various disciplines. Statistics centers and agencies in different countries consistently compile these indices, which depend on the prices of a basket of goods and services consumed by the household sector. The figures thus calculated constitute a time series that provides a measure of changes in the cost of living over time.

Therefore, Statistics Centre - Abu Dhabi has always taken interest in collecting the prices of those goods and services on a regular basis and publishes the indicators derived from this data, following the methodologies adopted internationally in this field.

The Price Indices Section at the Statistics Centre - Abu Dhabi compile CPI according to households’ levels of welfare and type. For the welfare level approach, the population is divided into five segments (quintiles), which represent five standard of living levels based on average annual expenditure per capita.

For the household type approach, the population is divided into three types of households as set out in the results of the Household Income and Expenditure Survey (2007), namely, Citizen, Non-Citizen and Share households.

To represent all regions of the Emirate, the selected sample of items included in the Consumer Price Index basket uses actual data from the Household Income and Expenditure Survey 2007. The sample of outlets were selected in such a way to represent points of purchase for a large base of consumers all over the Emirate of Abu Dhabi, taking into account the geographical distribution of sources within the Emirate.
Key Points

This publication provides an analysis of the results of the CPI for the month of June 2015 with the base year 2007. In addition, the publication provides the results of the CPI by household welfare levels, household type and regions for June 2015. The main findings of this analysis are outlined below:

- The CPI increased by 1.1% in June 2015 compared with May 2015.

- Consumer prices for households of the bottom and top welfare quintile increased by 1.0% during June 2015 compared with May 2015, while consumer prices grew by 1.2% for the middle household welfare quintile.

- The rise in consumer prices for June 2015 compared with May 2015, pushed up consumer prices for citizen households by 1.0%, 1.2% for non-citizen households and 1.1% for share households.

- The CPI increased by 1.2% in the second quarter 2015, compared with the first quarter of 2015.
Consumer Price Index (CPI) for June 2015 (2007=100)

A. Second quarter of 2015 compared with the first quarter of 2015

The average consumer prices increased by 1.2% in the second quarter of 2015 compared with the first quarter of 2015. This overall increase in prices reflects the net movement (increases and decreases) of consumer prices during the periods compared.

The most significant groups, which experienced increases in prices during the second quarter of 2015 compared with the first quarter of 2015, were ‘Restaurants and hotels’ with 3.0%, followed by ‘Housing, water, electricity, gas and other fuels’ with 2.1%.

B. CPI of June 2015 compared with the CPI of May 2015

The average consumer prices increased by 1.1% in June 2015 compared with May 2015. This overall increase in prices between the two months reflects the net movement (increases and decreases) of consumer prices during the periods compared.

The most significant groups, which experienced increases in prices during June 2015 compared with May 2015, were ‘Housing, water, electricity, gas and other fuels’ with 2.0%, ‘Food and beverages’ with 1.2%.

C. CPI by household welfare level

CPI by household welfare level for the month of June 2015 compared with May 2015

In June 2015, consumer prices increased by 1.1% compared with May 2015. This caused an increase of 1.0% in consumer prices for households in the bottom and the top welfare quintile, and by 1.2% for households in the middle welfare quintile.

E. CPI by region

Share of the regions in the average price change in the Emirate of Abu Dhabi for June 2015 compared with May 2015:

The rise of 1.1% in consumer prices for June 2015 compared with May 2015, resulted from the rise of consumer prices in the regions of Abu Dhabi, Al Ain and Al Gharbia. The increase in the CPI in the Abu Dhabi region contributed 73.8% of the total increase in June 2015 compared with May 2015, while the Al-Ain region contributed 19.7% and the Al Gharbia region 6.5% of the total increase during the period.

1. Consumer Price Index – Abu Dhabi Region
   - The CPI increased by 1.2% in June 2015, compared with May 2015.

2. Consumer Price Index- Al Ain Region
   - The CPI increased by 0.9% in June 2015, compared with May 2015.

3. Consumer Price Index - Al Gharbia Region
   - The CPI increased by 1.0% in June 2015, compared with May 2015
Next release:

The CPI for July 2015 will be released on 15 August 2015. For more information on prices and other official statistics, please visit the SCAD website at http://www.scad.ae
CPI Methodology

Introduction
Statistics Centre- Abu Dhabi is the sole official body responsible for calculating and publishing the Consumer Price Index (CPI) within the Emirate of Abu Dhabi. The Centre updated the CPI base year to 2007 for both prices and weights in 2008. Weights that are used in the new CPI were calculated using the results derived from the Household Income and Expenditure Survey 2007, which was carried out in the Emirate of Abu Dhabi. The methodology used in calculating the CPI follows best international recommendations and practices in this field.

What is the Consumer Price Index?
The CPI is a tool that measures the rate of change in the prices of a basket of goods and services between two periods. The period against which prices are compared is known as the base period and the period under review is known as the comparison period.

Importance of the Consumer Price Index
The CPI provides monthly estimates on the rate of change in the prices of a consumer price basket in the Emirate of Abu Dhabi. Some of the significant utilizations of the CPI are:

- The CPI is used as an important economic indicator to calculate inflation rates. The Inflation rate is a key statistic for economic policymaking and is used for adjusting payments (such as rents and wages).
- Salaries and wages are being adjusted by international entities and big corporations based on the change taking place in the CPI.
- The CPI is used as a deflator while producing national accounts at constant prices.

Updating the Consumer Price Index
The Consumer Price Index weights are updated on a regular basis once the necessary data becomes available. Usually the update takes place after releasing the results of the Household Income and Expenditure Survey, which is carried out periodically about every eight years. Updating the weights of goods and services of the CPI basket ensure that these weights represent as close as possible the current consumption pattern of households.

The last CPI update in the Emirate of Abu Dhabi took place in 2007-2008, where 2007 was regarded as the new CPI base year for both weights and prices.
1. CPI Compilation

The CPI is calculated using the Laspeyres method

\[ CPI_t = \sum \frac{P_{it}}{P_{0t}} \times W_{0i} \]

Prices of goods and services of the CPI basket are collected periodically, except for the vegetables, fruits, meat, fish and chicken groups which are collected on a weekly basis due to the continuous change that occur in its prices. Rentals prices are collected quarterly, while education fee prices are collected semi-annually.

The current CPI uses 2007 as the base year in the Emirate of Abu Dhabi. The current CPI basket consists of 334 goods and services, while the consumer basket contains 760 goods and services. The new CPI included the CPI of residential units occupied by their owners; this was done by adding the weight of this item to the weight of the rented residential units followed by calculation of a single index for all rented units.

The average item price at the 'elementary group level' is calculated using the geometric mean. Regarding the price ratio and the new weight, price ratio is calculated by dividing the comparison price by the base year price, and then the new weight is calculated by multiplying the price ratio by the base year weight.

To calculate the CPI on the sub-group level, the new weight of all goods and services of the sub-group should be added and then divided by the base price of the same group. The CPI of the main groups and the general CPI are calculated using the same method.

2. Weights

The Consumer Price Index is a weighted average of the change in the price of goods and services of the CPI basket. The weight of the good or service reflects its relative importance. The weight of good (C) is calculated by dividing the total expenditure of all households on the good (C) by the total expenditure of all households on all goods and services.

The relative importance \(^1\) of goods and services were calculated based on the results of the 2007-2008 Household Income and Expenditure Survey. Goods and services with a weight of 0.002 per cent or more were included in the CPI basket of goods and services. Goods with weights below this value were distributed proportionally among the other goods in the same group.

---

\(^1\) Relative importance of a given good or the weight of the good is the total expenditure of all households on the good divided by the total expenditure of all households on all goods and services.
3. **CPI basket and Consumer basket**

After calculating weights and identifying goods and services representing the CPI, the 334 goods and services in the consumer basket was identified. Each item in the CPI basket is represented by one good or service or more, therefore the consumer basket is larger than the CPI basket. The CPI basket includes 760 goods and services.

4. **Classifications used in the CPI**

The Classification of Individual Consumption according to Purpose (COICOP) is used in the construction of the CPI. The COICOP is a United Nations classification, which is used for statistical purposes. Based on the COICOP, goods and services of the CPI basket were classified into the 12 main groups, 34 subgroups (two digits) and 63 subgroups (three digits). The following table shows the main groups (one digit) and their weights:

<table>

5. Terms related to the CPI

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Price</td>
<td>Price is defined as the value of one unit of a product or service; this means the market value of the product or service. This value is established through the exchange of products and services in the markets. This value is equivalent to the benefit achieved by the consumer.</td>
</tr>
<tr>
<td>Consumer Price Index (CPI)</td>
<td>The Consumer Price Index (CPI) is a statistical indicator that measures changes in the level of prices of goods, services and rents of residential units within the consumer spending basket of households between two periods, the reference period and the comparison period.</td>
</tr>
<tr>
<td>Expected Inflation</td>
<td>Expected inflation is the expected rate of the rise in consumer prices. It is calculated using the CPI time series data by studying the movement of prices at the level of main and sub groups of the index basket, taking into account the seasonal changes. The expected inflation rates are statistical estimates, subject to increase or decrease depending on the unexpected changes in market prices.</td>
</tr>
<tr>
<td>Weight</td>
<td>Weight is the relative importance of a product or service within the CPI basket compared with all other products or services.</td>
</tr>
<tr>
<td>Outlet</td>
<td>Outlets where products or services are sold such as shops, supermarkets and stores.</td>
</tr>
<tr>
<td>Periods of Collection</td>
<td>Periods of collection are the adopted periods to repeat the survey of all groups in each basket. The period might be weekly, monthly or quarterly.</td>
</tr>
</tbody>
</table>

6. The Classification used in the CPI by household welfare

According to this classification, households were divided into five segments based on the average expenditure per capita in 2007, when the last Household Income and Expenditure Survey was carried out.

The bottom welfare quintile represented the segment with the lowest income, while the top welfare quintile represented the segment with the highest income.

7. Classification used in the CPI by household type

According to this classification, households were divided into three types, citizen, non-citizen and share household:

- Citizen household: is one person or more from the UAE citizens, who live permanently in the Emirate of Abu Dhabi. They should have a head, while their members might be related to each other or not and they should share accommodation and food.

- Non-citizen household; is one person or more who are non UAE citizen. The members of the non-citizen household should share accommodation and food, while they might be related or not and they should have a head. The household is considered non-citizen if the head is non-citizen and wife is non-citizen, even if the wife has citizen children from a previous marriage.

- Share household: is a group of persons (more than two) regardless of their nationalities. It should have a head and their members might be related to each other or not. The members of the share household share accommodation but they normally do not share food.

8. Geographical Scope

The current geographical scope of SCAD covers the Emirate of Abu Dhabi including all sub regions. However, the comprehensive coverage to the whole Emirate is essential but it requires a huge effort in order to collect the prices on a regular basis from all the regions of the Emirate.

9. Sources of Goods and Services

Sources used for the collection of price data were determined through field visits conducted by a team from SCAD’s Price Indices Section. The team updates SCAD on a regular basis if any source closes down or relocates premises. While choosing a source, it has been taken into consideration that it should
represent a large segment of consumers in the Emirate of Abu Dhabi. Price data are currently collected from 180 sources.

10. Collection of Price Data
Price data collection is a crucial stage that requires a significant amount of time and effort. The collection of price data is conducted by a group of employees who are well trained. To ensure the accuracy of the collected prices, the price of a sample of goods and services are reviewed through field visits. Each group of prices is collected differently, some is collected weekly, and others are collected monthly and quarterly.

In order to develop the price collection mechanism and cope with the latest IT trends, SCAD developed a comprehensive system that aims at calculating CPI using tablets.

The system aims at:
- Automation of all CPI stages.
- Provision of electronic programs and tools required for the price data collection (field collection) and transfer of data to the tablets, in addition to receiving data and transfer to the prices database.
- Ability to examine data accuracy and integration at all stages of the system, including preparation of the goods and services basket, the field work and calculating the index.
- Ability to calculate the CPI for any region of the Emirate (according to the geographical scope).
- Ability to deal with special situations that June arise during data collection or CPI calculation such as disappearance of goods, resources, and changes in the goods.
- Determining the goods and services basket of the base year with the relative weights of the groups, in addition to calculating the prices of goods and services of the base year.
- Assisting data collectors while editing data by connecting the current database with the previous one.

11. Publishing
SCAD publishes the CPI and prices of consumer goods and service on a monthly basis, two weeks after the end of the month. SCAD also publish annual CPI results and inflation rates. The CPI can also be provided on CDs upon request.

12. How to read the CPI
The CPI reflects the rate of the change in the prices of a specified goods and services basket between two periods, the base period and the comparison period. For example, if the price of the goods and services basket during a specified base period is AED 100, and the CPI of the comparison period was 105.0, this means that prices of goods and services increased by 5%.
In order to measure the change in the prices of the current period and the previous period, the current CPI should be divided by the previous CPI, and the result then multiplied by (100) followed by subtracting 100.

13. The expected inflation

The expected inflation is of great importance; it indicates the future inflation rates, which are used to create future monetary policies by banks and financial establishments.

Kindly note, the expected inflation rate is a statistical estimate that might increase or decrease according to the unexpected changes of the market.
